

Day 3

BRD vs FRD vs User Story

BRD	FRD	User Story
Business Requirement Document Why the business need it (Main Focus) It is written for Business/stakeholders It is high-level in detail Eg- Reduce manual attendance Time	Functional Requirement What the system should do for It is written for QA, Developers, BA It is detailed Eg- System shell record attendance when an NFC card is tapped.	User story what a user wants to achieve It is written for Agile team It is short and simple Eg- As a teacher I want attendance to be recorded automatically so that I can save classroom time

Business Rule	Functional Role	UI Rule
It focus on what business policy applies	It focuses on system behavior	It focuses on how the system should appear behave on screen
These rules are defined by Business/stakeholders.	These rules are defined by BA, developer, QA	These rules are defined by UI/UX designers, BA, developers.
It is use to define business conditions and Policies	It define how system behave based on requirements.	It defines the interfe appearance and interaction
Eg: It uses Business Policies, laws, org rules to these rules. -check weather it follows business policy.	It uses Business reqs and function req. to form functional rule	It uses UX requirement design standards, functional requirements
Eg: Students need 80% attendance to sit for exam.	It check through functional testing	It is checked through UI testing
	Eg: The systers shell mark students below 80% as ineligible	Eg: Students below 80% shell be displayed in red.

Business Rule vs Functional Rule vs UI Rule.

Static Review Techniques

Static testing means checking a work product like a doc or code without running it. Reviews are the main manual way of doing static testing, and there are four common types of reviews from very casual to very formal.

i) Informal review

→ A simple review without a formal process
eg- Development Developer asks a teammate to quickly look over a requirement.

ii) Walk through

→ The author explains the doc/code to other team members.

eg - BA presents requirements to developers and QA and explains each requirement.

iii) Technical Review

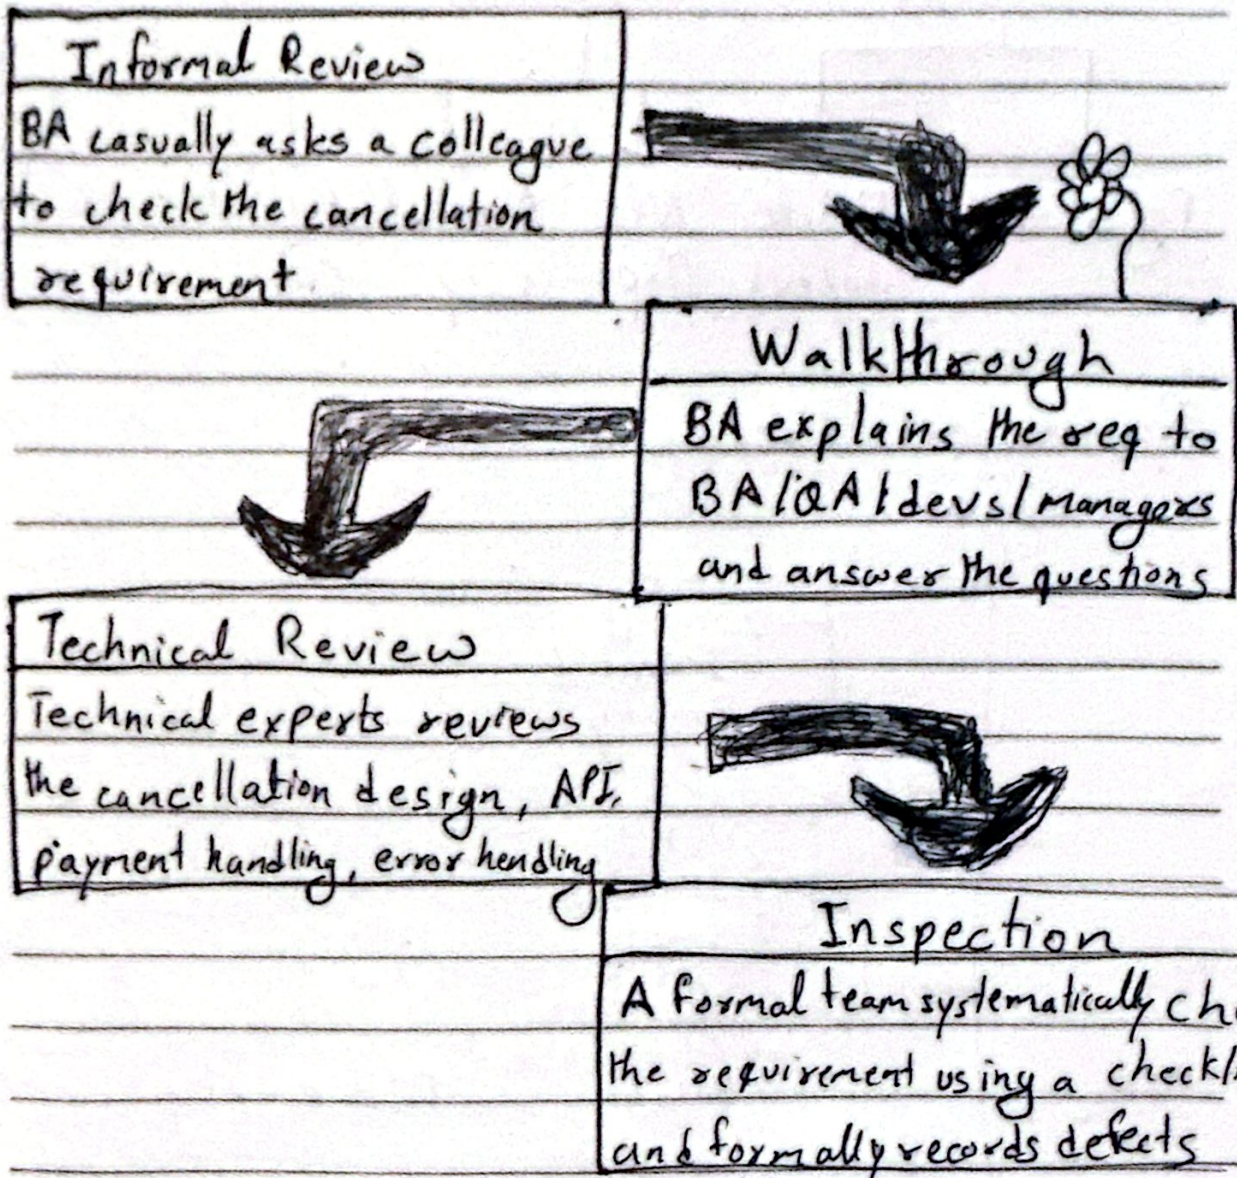

→ Technical experts examine that work to identify technical problems. It mainly focus on

- Technical correctness
- Standards
- Design
- Architecture
- Maintainability

iv) Inspection

→ The most formal review technique. It follows a defined process with roles, preparation, checklists, defect logging, etc. It focuses on

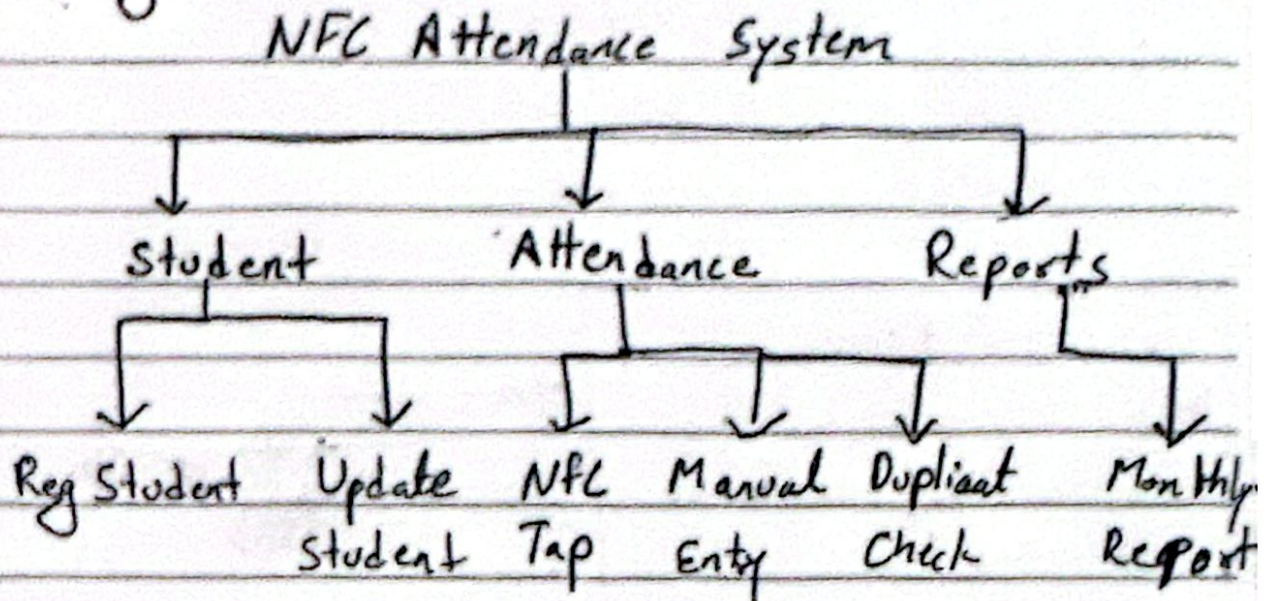

- Finding defect systematically
- Compliance with standards
- Detailed examination

Mind map

It is a visual way of organizing and breaking down information around one main idea.

for eg.

Requirement : User Login
