

Day 5 Week 2

Shift Left Testing

It is a testing approach where testing activities are started early in the SDLC life cycle to identify and fix defects during the initial stages of development.

Ad hoc Testing

It is an informal, unstructured STT where testing is performed without any planning, doc, or predefined test cases. Random checks to find bugs.

Exploratory Testing

It is an informal approach where learning, test design, and test execution happen at the same time.

ISO 25010 (International standard)

i) functional suitability	vi) Security
ii) Compatibility	vii) Integrity
iii) Operability	viii) Maintainability
iv) reliability	ix) Reusability
v) availability	x) Scalability
vi) fault tolerance	xi) Replaceability
Self descriptiveness

Techniques for selection in Regression

i) Correlation Analysis

It help to identify linear relationships between features and the target variable. high correlation more imp.

ii) Univariate Selection

It involves selecting features based on their individual relationship with the target variable.

iii) Recursive Feature Elimination

It eliminates less imp features until the desired number of feature is reached

iv) Lasso Regression

It adds a penalty equal to the absolute value of the coefficients to the loss function effectively shrinking some coefficients to zero

v) Feature importance from Tree Based models

It indicates which inputs are most imp. for making the prediction.

vi) Dimensionality Reducing Techniques

It reduce the number of features in a dataset while keeping as much useful information as possible.
