Date / /

Week 6 Day 4

Performance Testing

It evaluates how well an application performs under expected and peak workloads.

Types of Performance Testing

i) Load Testing

It simulates expected real world user load to evaluate system performance and identify bottlenecks under normal conditions.

ii) Stress Testing

It evaluates system behavior beyond normal limits to find breaking points and recovery capability under extreme load.

iii) Spike Testing

It check system response to sudden and sharp increases in user traffic to detet instability during traffic surges.

iv) Soak Testing

It tests system performance under continuous load for long duration to identify memory leaks and resource issues.

Memo No. _____

Date / /

Endurance Testing

- ~~Large amount of~~ Steady workload to check does it degradates any performance if done for a longe time.

Volume testing

It evaluates system performance while processing large volume of data in the database to check scalability limits.

Scalability Testing

Measures the system's ability to scale up or down efficiently as user load increases or decreases.

Apache JMeter

It is a open source load and performance testing tool which support multiple protocols and simulates multiple virtual users to evaluate application perf... generate graphical reports and detailed performance metrics

Elements in Jmeter

The different component of Jmeter are called element each having their specific purpose.

Thread Group

It is a collection of threads where each thread represents one user using the application under test.

Samplers

It is a different type of requests. send by thread group. such as TFP, HTTP

Listeners

It shows the results of the test execution in different formate graphs, table, logs file. tree.

Configuration Elements

It is used to setup defaults and variables for later use by samplers. URL, Datasets,
