

Technical Learning Report: Day 5

- **Date:** September 7, 2026
- **Intern Name:** Shekhar Singh Rawal
- **Subject:** Week 1 Revision, Test Planning & Estimation

1. Objective

The objective of Day 5 was to revise the major concepts covered during Days 1–5, with greater emphasis on **SRS, Test Plan, and Test Strategy**. The day also focused on understanding basic **test estimation techniques**, including Work Breakdown Structure, Three-Point Estimation, and Function Point Method. In addition, Selenium was introduced as a future automation testing topic, and Java was installed as preparation for upcoming Selenium learning.

2. Technical Breakdown

A. Week 1 Revision

A short revision was conducted covering the major topics learned during the first five days, including:

- Software Testing fundamentals.
- SDLC models and test levels.
- Requirement analysis.
- Business, Functional, and UI rules.
- Static review techniques.
- SRS and requirement understanding.
- Test planning and test strategy.

B. SRS, Test Plan and Test Strategy

Greater emphasis was given to understanding the relationship between **SRS, Test Plan, and Test Strategy**.

- **SRS:** Used as the source for understanding system requirements and expected system behavior.
- **Test Plan:** Defines what will be tested, the testing scope, approach, resources, schedule, risks, and testing activities.

- **Test Strategy:** Defines the overall approach and direction for testing, including how testing will be performed.

The revision helped connect requirements with test planning and the overall testing approach.

C. Test Estimation Techniques

Three estimation approaches were studied:

1. **Work Breakdown Structure (WBS)**

Breaking a testing activity into smaller tasks so that individual activities can be identified and estimated.

2. **Three-Point Estimation**

Estimation using three values:

- Optimistic estimate
- Most likely estimate
- Pessimistic estimate

3. **Function Point Method**

An estimation approach based on the functional size of the application.

D. Selenium and Java

Selenium was introduced as a topic for future automation testing learning.

Java was installed as preparation for learning and working with Selenium in the upcoming days.

3. Practical Implementation

A. DemoQA Book Store Application

The **DemoQA Book Store Application** was selected for practical testing and learning.

- **Application:** DemoQA Book Store Application
- **Module:** Login

The application and Login module were used as the practical context for connecting requirements, test planning, and testing concepts.

B. Test Documentation Revision

The Test Plan and Test Strategy were revised with greater focus on how they support testing of an application and how they relate to the requirements documented in the SRS.

C. Estimation Practice

The three estimation techniques were studied and applied conceptually to understand how testing work can be divided and estimated using:

- Work Breakdown Structure.
- Three-Point Estimation.
- Function Point Method.

D. Selenium Preparation

Java was successfully installed as preparation for future Selenium automation learning.

4. Key Findings & Best Practices

- SRS provides the requirements that form the basis for understanding what the application should do.
- The Test Plan provides a structured plan for testing the application.
- Test Strategy defines the overall direction and approach to testing.
- Test estimation helps break testing work into manageable activities and determine the effort required.
- WBS focuses on breaking work into smaller tasks.
- Three-Point Estimation considers optimistic, most likely, and pessimistic estimates.
- Function Point Method focuses on the functional size of the application.
- Selenium was identified as a future automation testing topic.
- Java was installed as preparation for upcoming Selenium learning.

5. Conclusion

Day 5 provided a revision of the major concepts covered during Days 1–5, with particular emphasis on **SRS, Test Plan, and Test Strategy**. The day also introduced three test estimation techniques: **Work Breakdown Structure, Three-Point Estimation, and Function Point Method**. Practical focus was given to the **DemoQA Book Store Application Login module**, while Java was installed to prepare for future Selenium automation testing activities.
