| <b>21. Test Schedule.....</b>                      | <b>16</b> |
| <b>22. Planning Risks and Contingencies.....</b>   | <b>16</b> |
| <b>23. Test Closure.....</b>                       | <b>16</b> |
| <b>Final Test Summary Example.....</b>             | <b>17</b> |
| <b>24. Tools.....</b>                              | <b>17</b> |
| <b>25. Approvals.....</b>                          | <b>17</b> |
| <b>26. Glossary.....</b>                           | <b>18</b> |

# 1. Introduction

The purpose of this test plan is to verify that the DemoQA Login module works correctly, securely, and consistently across supported environments.

Testing will cover authentication, input validation, error handling, session behavior, usability, compatibility, negative scenarios, and basic performance.

---

## 4. Objectives

The objectives are to:

- Verify valid users can log in successfully.
  - Verify invalid credentials are rejected.
  - Validate username and password fields.
  - Verify appropriate error/validation messages.
  - Verify password masking.
  - Verify session creation and logout.
  - Prevent unauthorized access.
  - Test negative and boundary inputs.
  - Verify browser compatibility.
  - Identify and report defects before release.
  - Verify fixes through retesting and regression testing.
- 

## 5. Scope

### 5.1 Features Included

- Login page/UI
- Username field
- Password field
- Login button
- Required-field validation
- Valid authentication
- Invalid authentication
- Error messages
- Password masking

- Input handling
- Boundary and special-character testing
- Session/login state
- Logout
- Unauthorized/direct URL access
- Back/refresh behavior after logout
- New User navigation
- Browser compatibility
- Basic performance
- Negative testing
- Regression testing

## 5.2 Features Excluded

- New User registration validation
- User profile functionality
- Book management
- Book purchasing
- Complete application business logic
- Production penetration testing
- Features outside the Login module

### Example:

Testing whether a user can successfully log in is **in scope**. Testing whether the user can add a book after login is outside the Login module's primary scope.

---

## 6. Software Risk Issues

These are risks **within the software** that may affect users or business.

| Risk                             | Impact   | Testing Response                 |
|----------------------------------|----------|----------------------------------|
| Valid user cannot log in         | Critical | High-priority functional testing |
| Invalid user gets access         | Critical | Security/negative testing        |
| Password displayed as plain text | High     | UI/security testing              |
| Logout does not end session      | High     | Session testing                  |

|                          |        |                       |
|--------------------------|--------|-----------------------|
| Incorrect error message  | Medium | Validation testing    |
| Login is very slow       | Medium | Performance testing   |
| Login fails on a browser | Medium | Compatibility testing |

---

## 7. Features to Be Tested

The main features and corresponding testing areas are:

| Feature        | Testing                                     |
|----------------|---------------------------------------------|
| Username       | Valid, invalid, empty, special characters   |
| Password       | Valid, invalid, empty, masking              |
| Login          | Positive and negative authentication        |
| Validation     | Empty/invalid input handling                |
| Error Messages | Accuracy and usability                      |
| Session        | Login, logout, expiry/back navigation       |
| Security       | Unauthorized access and credential handling |
| UI             | Alignment, labels, buttons, readability     |
| Compatibility  | Chrome, Firefox, Edge                       |
| Performance    | Login response baseline                     |

---

## 8. Features Not to Be Tested

The following are excluded from this test cycle:

- Registration functionality
- Profile functionality
- Book search and management
- Book purchase functionality

- Complete backend/database testing
  - Full penetration/security audit
- 

## 9. Test Approach / Strategy

Testing will follow a **risk-based and requirement-based approach**.

### Step 1 – Requirement Analysis

Understand login requirements and identify:

- Functional requirements
- Validation rules
- Security expectations
- UI expectations
- Session behavior

### Step 2 – Test Design

Test cases will be created using:

- **Equivalence Partitioning** – divide inputs into valid/invalid groups.
- **Boundary Value Analysis** – test values around input limits.
- **Decision Table Testing** – test combinations of username/password conditions.
- **State Transition Testing** – test Logged Out → Logged In → Logged Out.
- **Use Case Testing** – test complete user login flow.
- **Error Guessing** – test likely failure conditions.
- **Exploratory Testing** – investigate unexpected behavior.

### Step 3 – Test Execution

1. Perform Smoke Testing.
2. Reject/block the build if critical login functionality is unavailable.
3. Execute functional and negative test cases.
4. Perform security, session, UI and compatibility testing.
5. Report defects.
6. Retest fixes.
7. Perform regression testing.
8. Prepare final test report.

---

## 10. Example Test Scenarios

| ID    | Scenario                            | Expected Result                  |
|-------|-------------------------------------|----------------------------------|
| TS-01 | Login with valid credentials        | User successfully logs in        |
| TS-02 | Invalid username + valid password   | Login rejected                   |
| TS-03 | Valid username + invalid password   | Login rejected                   |
| TS-04 | Invalid username + invalid password | Login rejected                   |
| TS-05 | Empty username                      | Validation/error displayed       |
| TS-06 | Empty password                      | Validation/error displayed       |
| TS-07 | Both fields empty                   | Validation/error displayed       |
| TS-08 | Password field input                | Password is masked               |
| TS-09 | Logout                              | User is logged out               |
| TS-10 | Access protected page after logout  | Access is denied/redirected      |
| TS-11 | Browser back after logout           | Logged-out state remains         |
| TS-12 | Special-character input             | Application handles input safely |

---

## 11. Example Decision Table

| Username | Password | Expected Result  |
|----------|----------|------------------|
| Valid    | Valid    | Login successful |
| Valid    | Invalid  | Login rejected   |
| Invalid  | Valid    | Login rejected   |
| Invalid  | Invalid  | Login rejected   |
| Empty    | Valid    | Validation/error |

|       |       |                  |
|-------|-------|------------------|
| Valid | Empty | Validation/error |
| Empty | Empty | Validation/error |

This ensures important combinations are not missed.

---

## 12. Pass/Fail Criteria

### Pass

A test passes when:

- Actual result matches expected result.
- Required validation works correctly.
- No unexpected behavior occurs.
- Evidence supports the result where required.

### Fail

A test fails when:

- Actual result differs from expected result.
- Required functionality does not work.
- Incorrect validation/error occurs.
- Unauthorized behavior is observed.

### Example:

Expected: Invalid password should be rejected.

Actual: User successfully logs in.

→ **FAIL + Security/Critical defect**

---

## 13. Suspension and Resumption Criteria

Testing will be suspended if:

- Login page is unavailable.
- Login button does not function.
- Application crashes.
- Backend/authentication service is unavailable.
- Valid test credentials/data are unavailable.
- A critical blocker prevents meaningful testing.

**Testing will resume when:**

- Blocking issue is fixed.
  - Environment is available.
  - Required test data is available.
  - Smoke testing passes.
- 

## 14. Defect/Bug Reporting and Management

Every deviation between expected and actual behavior will be evaluated and reported when it is confirmed as a defect.

### Defect Lifecycle

**New → Assigned → Open → Fixed → Retest → Verified → Closed**

If the fix fails:

**Retest Failed → Reopened → Fixed → Retest**

### Required Bug Report Fields

| Field         | Example                              |
|---------------|--------------------------------------|
| Bug ID        | BUG-LOGIN-001                        |
| Title         | Login succeeds with invalid password |
| Module        | Login                                |
| Environment   | Chrome / Windows                     |
| Preconditions | Valid username available             |

|               |                                                 |
|---------------|-------------------------------------------------|
| Steps         | Enter valid username → invalid password → Login |
| Expected      | Login should be rejected                        |
| Actual        | User is logged in                               |
| Severity      | Critical                                        |
| Priority      | P1                                              |
| Evidence      | Screenshot/video                                |
| Status        | New                                             |
| Assignee      | Developer                                       |
| Retest Result | Pass/Fail                                       |

### Severity

- **Critical:** Major security/functionality failure.
- **High:** Major functionality unavailable.
- **Medium:** Functionality affected but workaround exists.
- **Low:** Minor UI/cosmetic issue.

### Priority

- **P1:** Fix immediately.
- **P2:** Fix before release if possible.
- **P3:** Can be fixed later.

### Example:

Login accepts incorrect passwords → **Critical Severity + P1 Priority.**

---

## 15. Retesting and Regression Testing

### Retesting

Retesting verifies that a reported defect has been fixed.

**Example:**

BUG-LOGIN-001: Invalid password allows login.

After the developer fixes it, execute the same test again.

**Regression Testing**

Regression testing verifies that a fix has not broken existing functionality.

**Example:**

After fixing password validation, also test:

- Valid login
  - Invalid login
  - Empty password
  - Logout
  - Session behavior
- 

## 16. Test Metrics and Reporting

The following metrics will be recorded:

| Metric           | Formula                                                      |
|------------------|--------------------------------------------------------------|
| Execution %      | $\text{Executed} \div \text{Planned} \times 100$             |
| Pass %           | $\text{Passed} \div \text{Executed} \times 100$              |
| Fail %           | $\text{Failed} \div \text{Executed} \times 100$              |
| Defect Closure % | $\text{Closed} \div \text{Total Defects} \times 100$         |
| Retest Pass %    | $\text{Passed Retests} \div \text{Total Retests} \times 100$ |

**Example**

If 50 test cases are planned:

- Executed = 50
- Passed = 45
- Failed = 5

- Defects = 5

Execution = **100%**

Pass Rate = **90%**

Fail Rate = **10%**

---

## 17. Test Deliverables

| Deliverable           | Purpose                                       |
|-----------------------|-----------------------------------------------|
| Test Plan             | Defines testing scope, approach and resources |
| Test Scenarios        | Identifies functionality to test              |
| Test Cases            | Provides detailed test steps                  |
| Test Data             | Provides required inputs                      |
| Bug Reports           | Documents defects                             |
| Test Execution Report | Records test results                          |
| Retest Report         | Records verification of fixes                 |
| Test Summary Report   | Provides final testing status                 |

---

## 18. Requirements Traceability

Requirements will be mapped to test scenarios and test cases.

**Requirement → Scenario → Test Case → Result → Defect**

Example:

**REQ-LOGIN-001:** User must log in with valid credentials.

↓

**TS-LOGIN-001:** Login using valid credentials.

↓

**TC-LOGIN-001:** Enter valid username/password.

↓

**PASS/FAIL**

↓

**BUG-LOGIN-001** if failed.

This ensures that no important requirement is left untested.

---

## 19. Test Environment and Configuration

### Hardware

- Desktop/Laptop
- Mobile/Tablet where applicable

### Operating Systems

- Windows
- Android/mobile environment where applicable

### Browsers

- Google Chrome
- Mozilla Firefox
- Microsoft Edge

### Other Conditions

- Normal network
- Slow/intermittent network
- Browser DevTools
- Screenshot/recording tools
- Test management/bug tracking tool

### Configuration to Record

- Application URL
- Application build/version
- OS/version

- Browser/version
  - Device
  - Screen resolution
  - Network condition
  - Test data
  - Execution date
- 

## 20. Staffing and Training Needs

### Required Roles

- QA/Test Engineer
- QA Lead
- Developer
- Project Manager
- Business Stakeholder

### Training

Testers should understand:

- Application requirements
  - Login functionality
  - Test design techniques
  - Defect reporting
  - JIRA/Zoho or selected tracking tool
  - Basic security/session testing
  - Browser DevTools
- 

## 21. Roles and Responsibilities

| Role             | Responsibility                                      |
|------------------|-----------------------------------------------------|
| QA/Test Engineer | Design, execute, report, retest and regression test |

|                      |                                       |
|----------------------|---------------------------------------|
| QA Lead              | Review plan/cases and monitor quality |
| Developer            | Analyze and fix defects               |
| Project Manager      | Schedule and resource management      |
| Business Stakeholder | Clarify requirements and acceptance   |

QA Team                      Prepare final test summary

---

## 22. Time Estimation

| Activity                  | Estimated Effort |
|---------------------------|------------------|
| Requirement Analysis      | 2 hrs            |
| Test Plan                 | 3 hrs            |
| Scenario Creation         | 2 hrs            |
| Test Case Creation        | 4 hrs            |
| Test Case Review          | 1 hr             |
| Test Data/Environment     | 1 hr             |
| Smoke Testing             | 1 hr             |
| Functional Testing        | 5 hrs            |
| Negative/Boundary Testing | 3 hrs            |
| Security/Session Testing  | 3 hrs            |
| Browser/UI Testing        | 2 hrs            |
| Defect Reporting          | 1 hr             |
| Retesting                 | 2 hrs            |
| Regression Testing        | 2 hrs            |
| Test Summary Report       | 2 hrs            |

|                               |               |
|-------------------------------|---------------|
| <b>Total Estimated Effort</b> | <b>34 hrs</b> |
|-------------------------------|---------------|

**Note:** Actual effort may change depending on defects, application changes, environment availability, and additional testing cycles.

## 23. Test Schedule

## 24. Planning Risks and Contingencies

These risks affect the **testing process**, rather than the software itself.

| Planning Risk           | Contingency                          |
|-------------------------|--------------------------------------|
| Application unavailable | Perform documentation/design work    |
| Limited testing time    | Prioritize critical/risk-based tests |
| Environment unavailable | Use alternate environment            |
| Developer fixes delayed | Continue unaffected test areas       |
| Requirements unclear    | Contact BA/PM/stakeholder            |
| Browser unavailable     | Test supported alternative           |

---

Insufficient test data

Prepare additional test data

---

## 25. Test Closure

Testing will be considered complete when:

- Planned testing is completed.
- Critical login functionality has passed.
- Critical/High defects are fixed or formally accepted.
- Required retesting is completed.
- Regression testing is completed.
- Test results are documented.
- Outstanding risks are reported.
- Test Summary Report is prepared.
- QA Lead/stakeholder approval is obtained.

### Final Test Summary Example

**Overall Status: PASS / PASS WITH KNOWN ISSUES / FAIL**

The report should contain:

- Planned vs executed tests
  - Pass/fail results
  - Defect summary
  - Severity/priority distribution
  - Retest results
  - Regression results
  - Outstanding risks
  - Final recommendation
- 

## 26. Tools

- **JIRA / Zoho Sprints** – defect management
- **Excel** – test scenarios/test cases
- **Mind Map Tool** – requirement/test analysis

- **Browser DevTools** – debugging and network inspection
  - **Screenshot/Recording Tool** – defect evidence
  - **Word/Google Docs** – documentation
- 

## 27. Approvals

| Document            | Approval                       |
|---------------------|--------------------------------|
| Test Plan           | QA Lead / Project Manager      |
| Test Scenarios      | QA Lead                        |
| Test Cases          | QA Lead / Stakeholder          |
| Test Summary Report | QA Lead / Business Stakeholder |

---

## 28. Glossary

| Term          | Meaning                                                                  |
|---------------|--------------------------------------------------------------------------|
| AUT           | Application Under Test                                                   |
| QA            | Quality Assurance – prevents quality problems through processes          |
| QC            | Quality Control – identifies quality problems through testing/inspection |
| Test Case     | Detailed steps, data and expected result                                 |
| Test Scenario | High-level functionality to be tested                                    |
| Defect/Bug    | Flaw in the software                                                     |
| Error         | Human mistake that can introduce a defect                                |

|                |                                                            |
|----------------|------------------------------------------------------------|
| Failure        | Incorrect behavior observed during execution               |
| Risk           | Potential future problem                                   |
| Severity       | Impact of a defect                                         |
| Priority       | Urgency of fixing a defect                                 |
| Regression     | Testing existing functionality after changes               |
| Retesting      | Testing a previously failed test after its defect is fixed |
| Smoke Testing  | Basic testing to determine whether a build is testable     |
| BVA            | Boundary Value Analysis                                    |
| EP             | Equivalence Partitioning                                   |
| Authentication | Verifying who the user is                                  |
| Authorization  | Determining what the user can access                       |
| Session        | State maintained after successful login                    |
