Week 8 Day 1

1. Agile Testing Fundamentals.

It is a software testing approach where testing happens continuously alongside development. It focuses on collaboration, flexibility, early bug detection, and customer satisfaction.

Principles of Agile Testing

1. Continuous Feedback.
2. Parallel testing
3. Team involvement
4. Customer Focus
5. Lightweigh documentation
6. Early defect detection

Agile Values

- Individual and interaction over process and tools
- Customer collaboration over contract negotiation
- Responding to change over following a pl

Agile vs Traditional Testing

Agile Testing

- Testing happens continously alongsid dev.
- Testing is performed in ever sprint.
- Changes in requirements are easily accommodated
- Developers, testers, and customers collaborated regularly
- Bugs are detected and fixed early
- Delivers software in small, frequent releases.

Traditional Testing

- Testing happens after development usually.
- Testing is often a separat phase
- Changes can be difficult and costly
- Teams often work in separate phase
- Bug may be detected later
- Often software is delivered after completing major phases.

Continuous feedback

It means regularly sharing test results, defects, and suggestion with the team. Helps detects bugs in early stage, reduce fixing cost, improve overall quality of software

Agile Testing Quadrants.

It categorize testing into four quadrant based on whether testing is business-facing or technology-facting

TDD (Test Driven Development)

It focuses on testing code functionality Developer write test before writing the actual code.

TDD CYCLE

Red
Write a test that fails

Green
Write a test that pass

Refector
Improve the code without changing it's behavi

BDD (Behavior - Driven Development)

It focuses on application behavior from the user's perspective, Developers, testers, and business stakeholders collaborate to define expected behavior. It uses the Given - When - Then format.

QA's Role in Agile Sprint Ceremonies

QA works with developers and the Product Owner throughout the sprint to ensure software quality and defect defet early

1. Sprint Planning

QA reviews user stories, identifies risks, defines test scenairos, and estimates testing effort.

2. Daily Standup

QA share testing progess, reports bugs, and discusses blockers

3. Backlog Refinement.

QA reviews requirements, identifies edge cause, and clarifies acceptance criterea

before development starts.

4. Sprint Execution

QA designs and executes test cases reports defects, and performs regression test.

5. Sprint Review

QA helps demonstrate tested features and confirms whether acceptance criteria are met

6. Sprint Retrospective.

QA discusses testing challenges and suggests improvements for future sprints.
