Classes in Python

Class is a user defined template for creating an object.

Object is a instance of a class.

Constructor

It is a special method that runs automatically when the object is ~~called~~ created and setup its initial data.

Four Pillars of OOP

Inheritance

Polymorphism

Encapsulation

↳ Public, Private, Protected.

Data Abstraction

Mo	Tu	We	Th	Fr	Sa	Su
----	----	----	----	----	----	----

Memo No. _____

Date / /

Exception Handling

try, # risky code

except # if error happens

else # if no error

finally # Always run

Value Error

Type Error

Zero Division Error

Exception
