

Technical Learning Report: Day 3

Date: September 3, 2026
Intern Name: Shekhar Singh Rawal
Subject: Requirement Analysis & Business Logic

1. Objective

Day 3 focused on requirement analysis before writing test cases, covering the differences between BRD, FRD, and User Stories, the distinction between Business, Functional, and UI Rules, and static review techniques. Practical work applied these concepts by breaking down and classifying requirements for a Ticket App using a mind map.

2. Technical Breakdown

A. BRD vs. FRD vs. User Story

- **BRD:** Focuses on business need/policy. E.g., "Students need 80% attendance to sit for an exam."
- **FRD:** Focuses on system behavior. E.g., "The system must ensure students below 80% are ineligible."
- **User Story:** Expresses a requirement from the user's perspective in simple terms.

B. Business Rule vs. Functional Rule vs. UI Rule

Rule Type	Focus	Example
Business Rule	Business policy/conditions	Students need 80% attendance to sit for an exam
Functional Rule	System behavior	System must mark students below 80% as ineligible

UI Rule	Screen appearance/interaction	Students below 80% displayed in red
---------	-------------------------------	-------------------------------------

C. Static Review Techniques (informal → formal):

1. **Informal Review** — simple, no formal process (e.g., asking a teammate to check a requirement).
2. **Walkthrough** — author explains the work to the team, answers questions.
3. **Technical Review** — technical experts examine correctness, architecture, standards, design.
4. **Inspection** — most formal; uses defined roles, checklists, and formal defect logging.

D. Mind map for a Ticketing Application

3. Practical Implementation

- **NFC Attendance System mind map:** Broken into Student, Attendance, Reports branches with sub-items (Register/Update Student, NFC Tap/Manual Entry/Duplicate Check, Monthly Report).
- **Login requirement breakdown:** Split into Username, Password, Login Button, and Error Handling conditions (valid/invalid/empty states).
- **Ticket App mind map:** Broken into Ticket Lifecycle (Creation, Triage, Resolution, Closure), Reporting, User Interface, and Roles.
- **Ticket App rule classification:** Each requirement tagged as Business, Functional, or UI Rule (e.g., "Initial status is Open" → Business Rule; "Assign priority" → Functional Rule; "Ticket list" → UI Rule).

4. Key Findings & Best Practices

- Requirements should be broken down and classified before test cases are written.
- BRD, FRD, and User Story represent the same requirement from different perspectives (why, what the system does, what the user wants).
- A single feature can contain multiple rule types (Business, Functional, UI) at once.
- Static reviews range from casual (Informal Review) to fully systematic (Inspection), each suited to a different level of scrutiny.

5. Conclusion

Day 3 built the skill of reading and breaking down requirements like a business analyst — distinguishing BRD/FRD/User Story and classifying rules as Business, Functional, or UI. This was applied through mind maps for the NFC Attendance System, Login flow, and Ticket App, with the Ticket App requirements fully tagged by rule type. This groundwork supports writing accurate, well-scoped test conditions in the days ahead.
